### Brain Trauma For Dentistry Students

**Dr. Tareq Kanaan**

Director of Neurosurgery Dept.

Trephination dates back to 10 000 BC.

## Trepanation :

drilling a hole into the skull to expose dura and brain and treat related problems like damage of a subdural hematoma .

Same as **Burr hole**.

## Craniotomy:

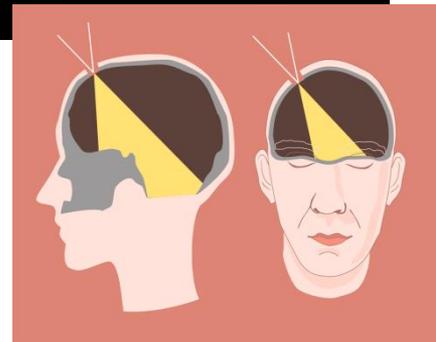

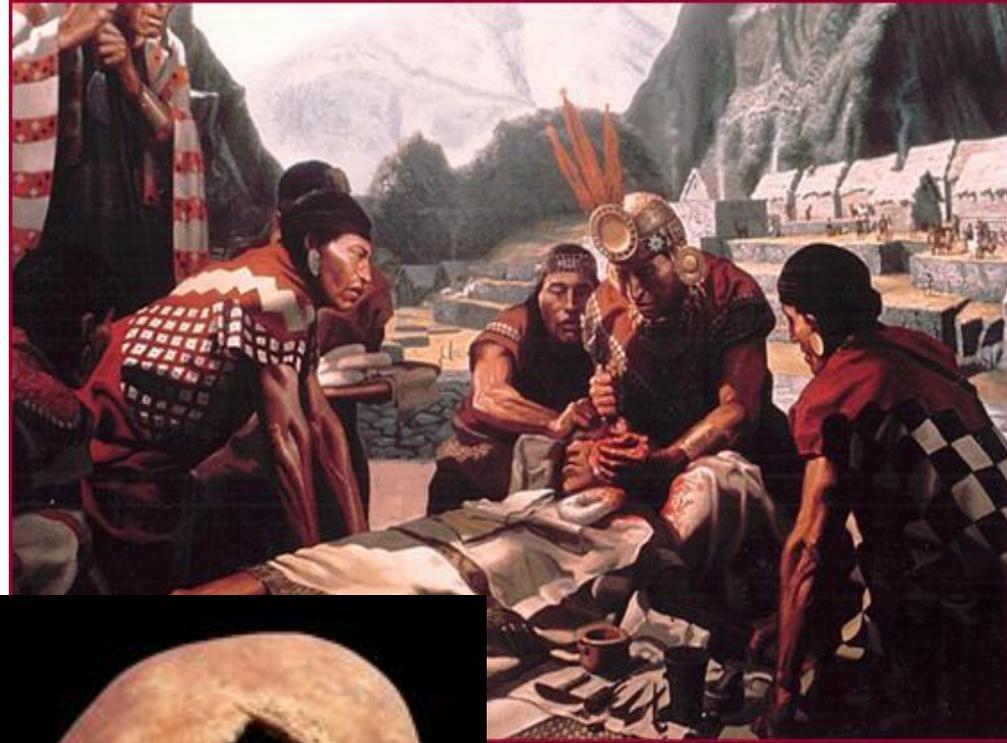

Removing a bone flap from the skull in order to perform surgery on dura or brain and fixing it back.

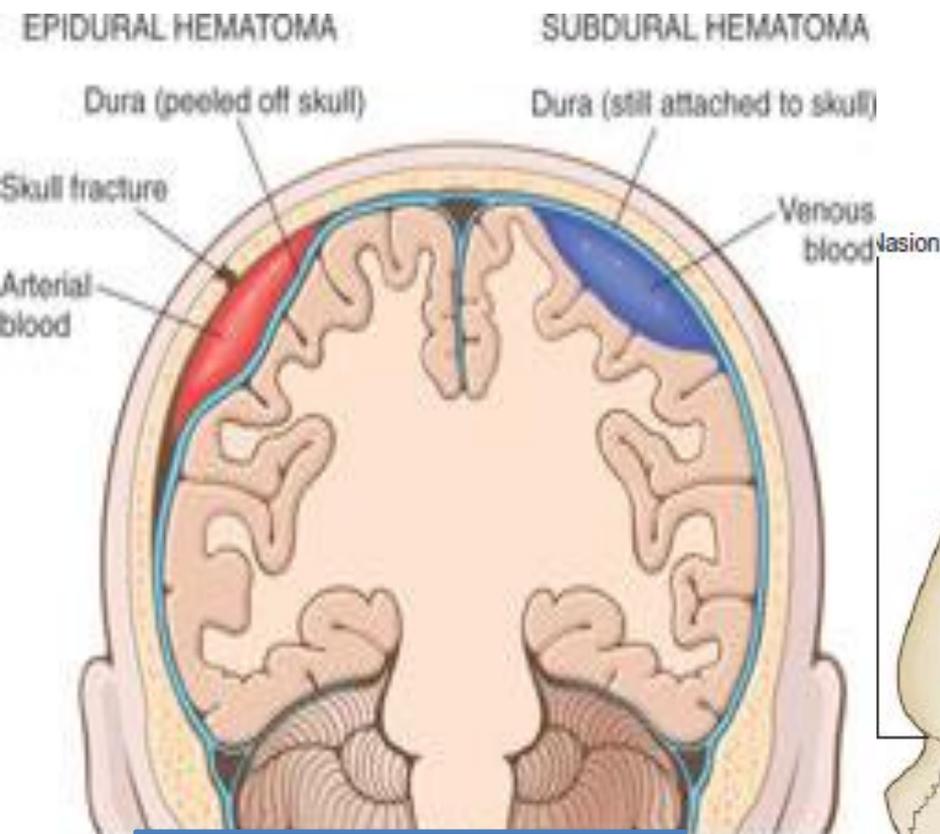

## Craniectomy:

Removing a bone flap away from the skull and not putting it back again in order to decompress the brain .

## Cranioplasty:

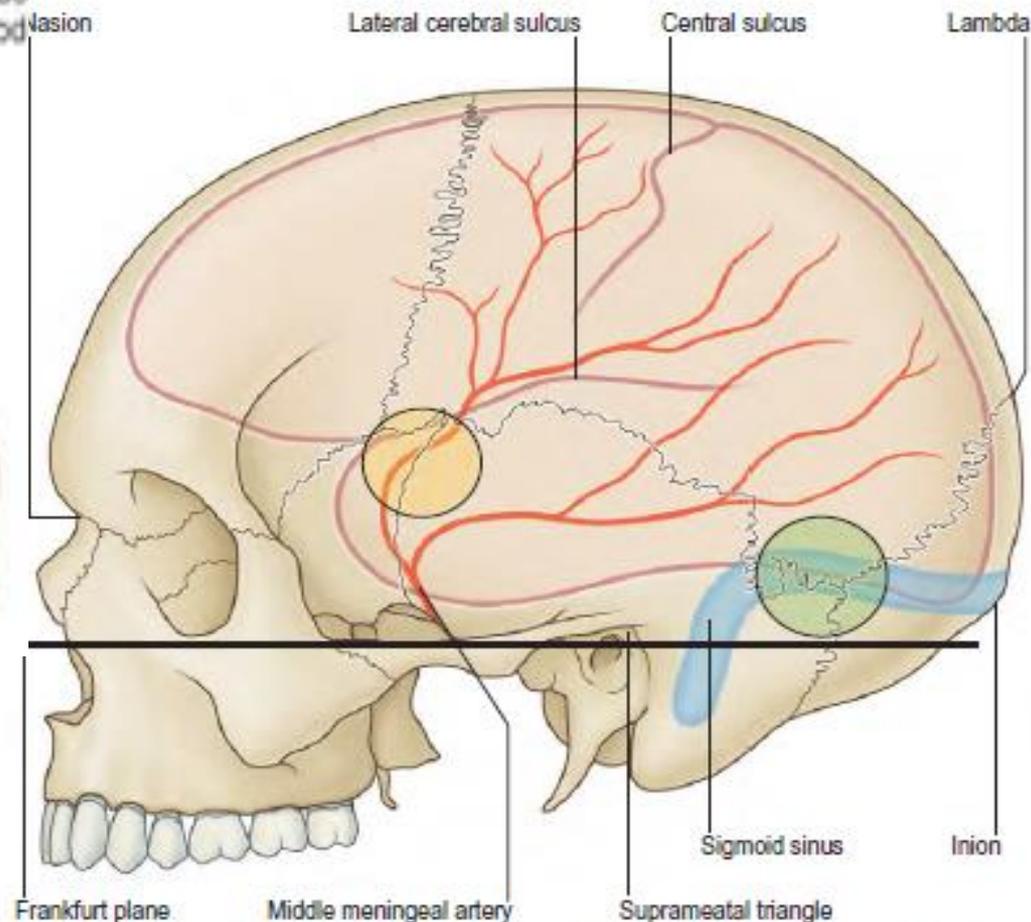

Putting back something else than the bone flap like titanium mesh or bone cement.

Epidural :above the dura  
Usually arterial  
**Middle meningeal Artery**

subdural :under the dura  
and above the brain  
Usually venous  
**Bridging Veins**  
**Venous sinuses**

**Fig. 27.7** The relations of the brain, the middle meningeal artery and the transverse and sigmoid sinuses to the surface of the skull. Area enclosed in yellow circle (including the pterion) for trephining over the frontal branch of the middle meningeal artery and lateral Sylvian fissure; area enclosed in green circle for trephining over the transverse sinus.

# Epidural = Extradural hematoma

- Typical appearance of EDH on CT scan :**
- **Bi convex lense shape**
  - **Arterial bleeding due injury to anterior branch of middle meningeal artery.**
  - **Usually due to trauma over the pterion ( weak point )**
  - **Treatment: craniotomy and evacuation of blood clot as it cannot be sucked out through a burr hole .**

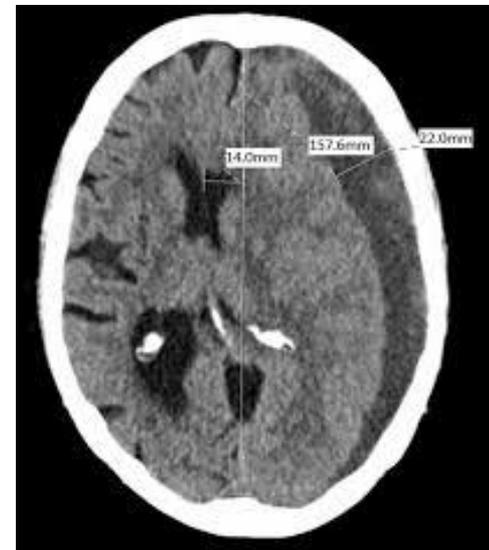

Typical EDH on CT scan :  
 Bi convex lense shaped  
 Always acute  
 Arterial bleeding

Typical acute SDH on CT scan:  
 Lunar shaped  
 bleeding is Hyperdense:  
 white like bone  
 Venous bleeding

Typical chronic SDH on CT scan:  
 Lunar shaped  
 bleeding is hypodense like CSF  
 Venous bleeding

## Lucid interval

lucid interval is a temporary improvement in a patient's condition after a traumatic brain injury, after which the condition deteriorates

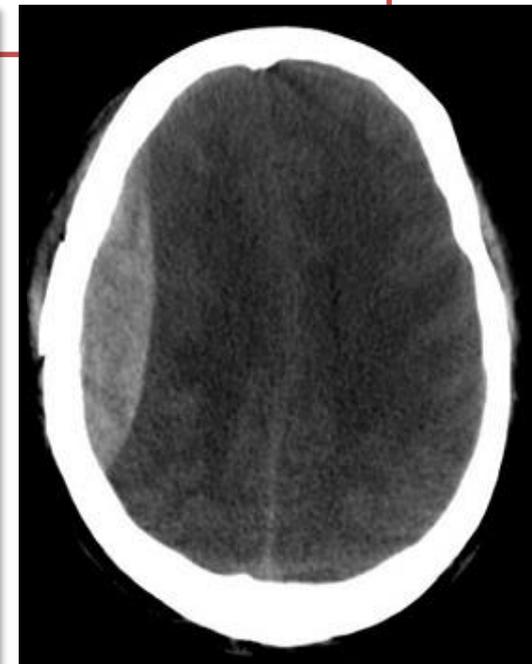

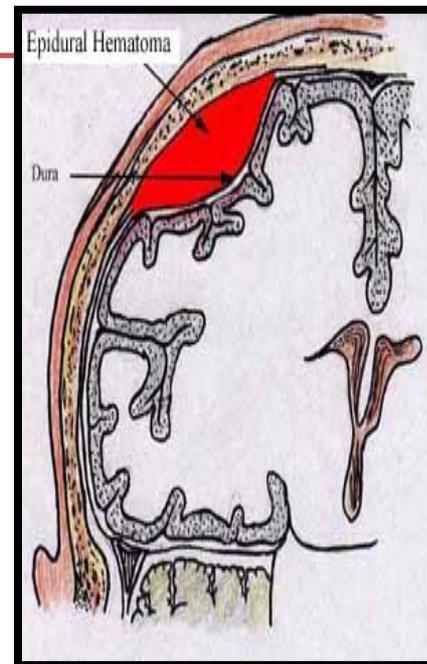

It occurs after the patient is knocked out by the initial concussive force of the trauma, then lapses into unconsciousness again after recovery when bleeding causes the hematoma to expand past the point at which the body can no longer compensate

A lucid interval is especially indicative of an epidural hematoma.

**An estimated 20 to 50%** of patients with epidural hematoma experience such a lucid interval.

It can last minutes or hours

To stop the hemorrhage, the torn artery or vein must be ligated or plugged. The burr hole through the skull wall should be placed about 1 to 1.5 in. (2.5 to 4 cm) above the midpoint of the zygomatic arch.

## Subdural Hemorrhage

A subdural hemorrhage is caused by a violent shaking of the head (e.g., child abuse or car accident) and commonly occurs in alcoholics and elderly..

The blood vessels involved are the **superior cerebral veins** (“bridging veins”).

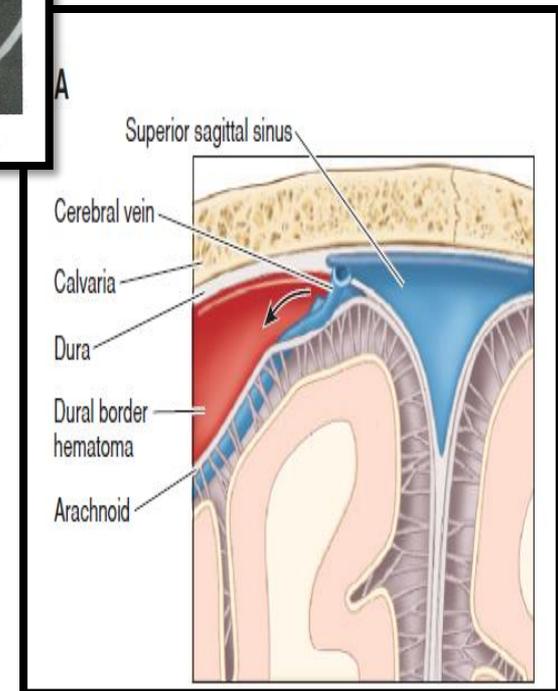

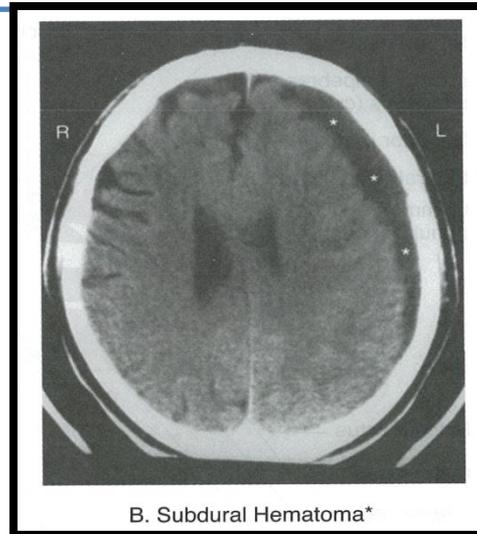

**Clinical features include:**

A CT scan shows a **thin, crescent-**

**shaped hyperdensity that hugs the contours of the brain; venous blood**

is located between the dura and arachnoid; blood accumulates slowly (days to weeks after trauma);

➤ **no blood in the CSF after lumbar puncture.**

### Raccoon eyes :

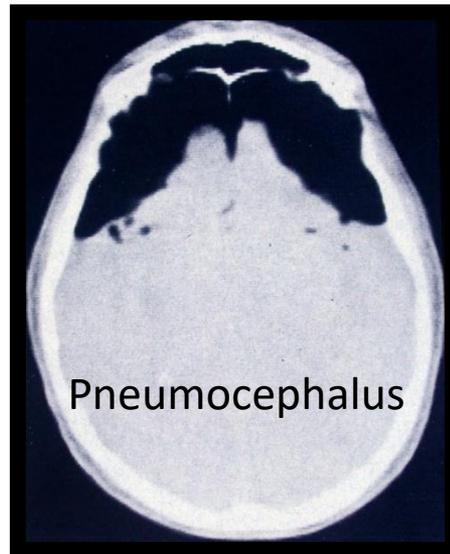

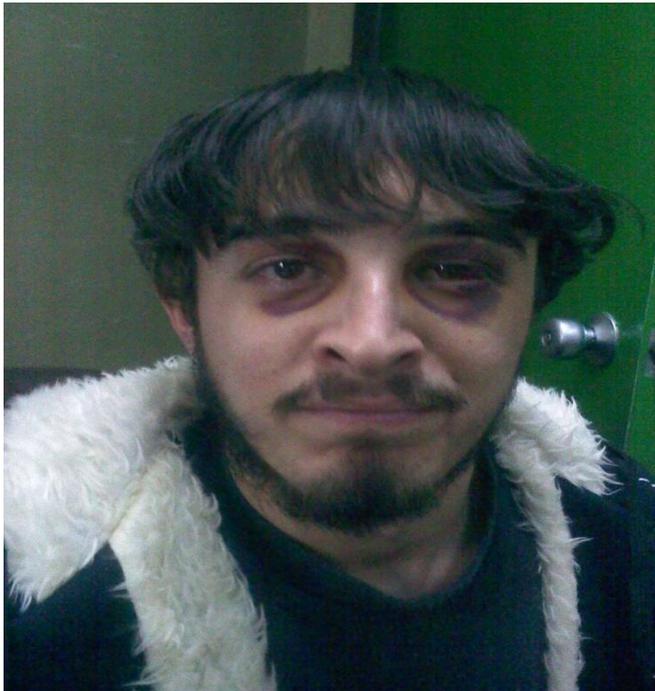

Indicates base of skull fracture even if we cannot see it on a CT scan .

### What other signs of base of skull fracture do you know??

- Battle sign: hematoma behind the ear
- Pneumocephalus : subdural air in CT scan.

### Why it is important to identify??

Bec. of possible serious complications like CSF rhinorea or otorrhea and then meningitis

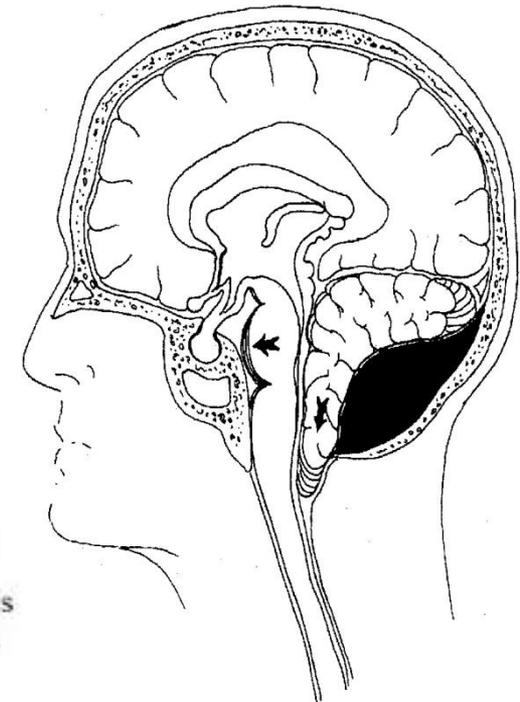

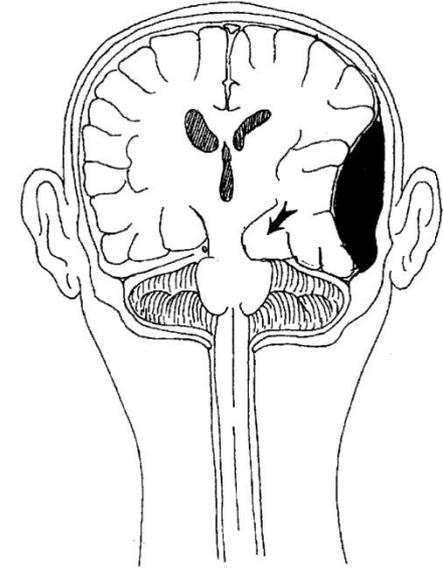

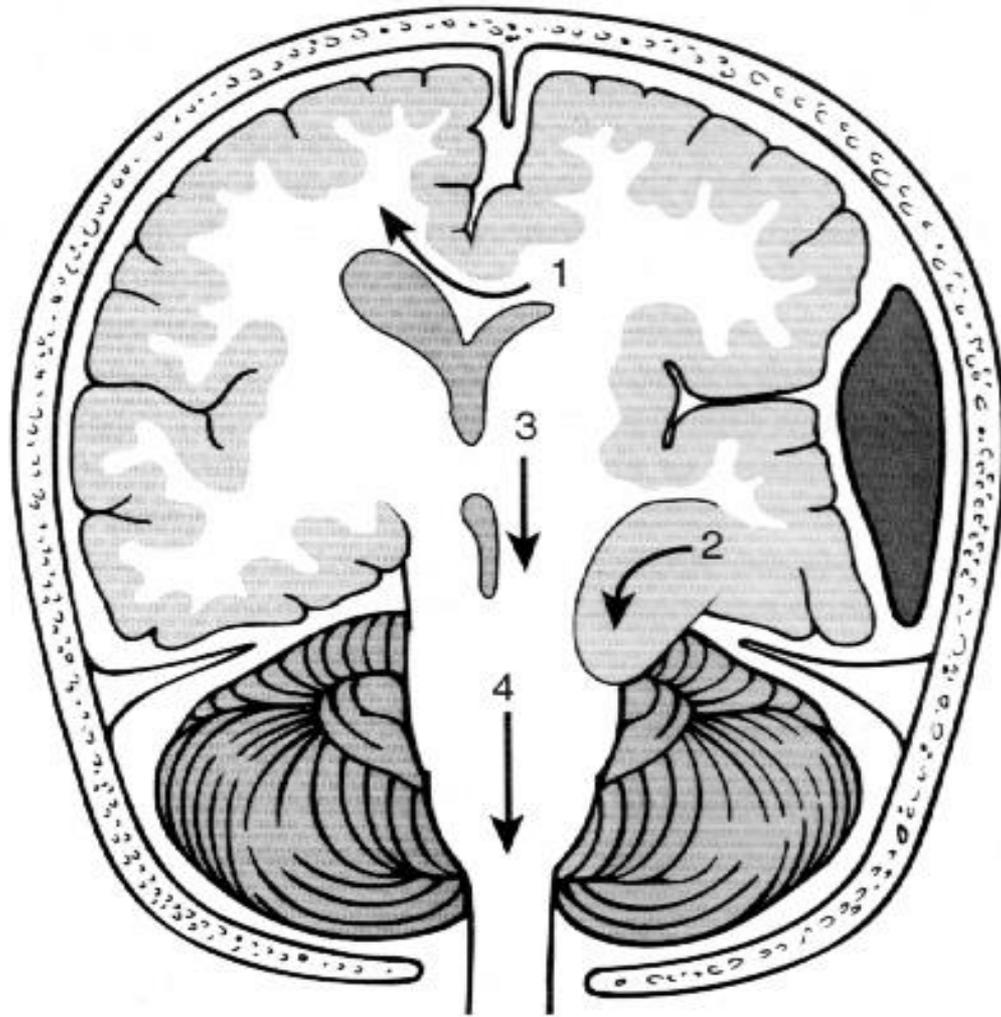

- **Brain Contusion :**

- Intra-parenchymal  
localized bleeding

- If it exceeds 3 cm then it  
is an intracerebral  
hematoma

**Fig. 3.3** Brain herniations. A lateral supratentorial mass will cause displacement of the lateral ventricles with (1) subfalcine herniation of the cingulate gyrus below the falx cerebri; (2) herniation of the uncus into the tentorial hiatus; (3) caudal displacement of the brain stem. Raised pressure within the posterior fossa may cause herniation of the cerebellar tonsils into the foramen magnum (4). (Adapted from Jennett and Teasdale 1981. Reproduced with permission.)
