

HEART FAILURE

Hanna K. AL-Makhamreh, MD
FACC

Associate Professor of Cardiology

University Of Jordan

PHYSIOLOGY (FRANK-STARLING) CURVE

- Preload reduction
 - Diuretics
 - venodilators
- Vasodilators
ACEI
- Inotropes
Dobutamine

PRESSURE-VOLUME LOOP

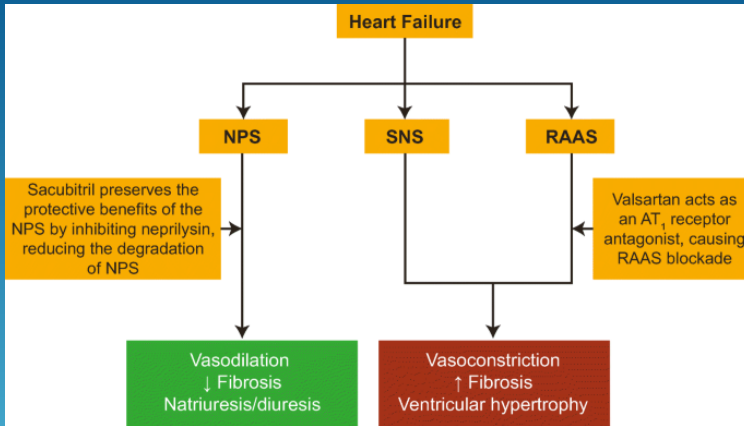

Figure 2

PATHOPHYSIOLOGY

- Initial Compensation for impaired myocyte contractility:
 - Frank-Starling mechanism
 - Neurohumoral activation
 - intravascular volume
- Eventual decompensation
 - ventricular remodeling
 - myocyte death/apoptosis
 - valvular regurgitation

PATHOPHYSIOLOGY OF HF

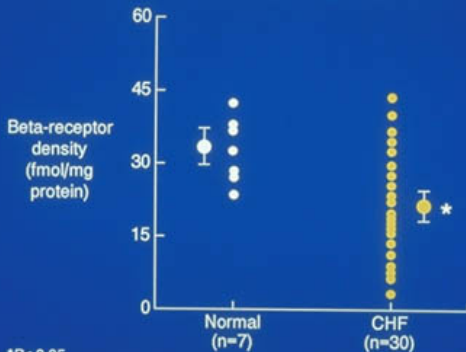

PATHOPHYSIOLOGY: NEUROHUMORAL

- Adrenergic nervous system
- Renin-angiotensin-aldosterone system
- Natriuretic peptides

NEUROHUMORAL

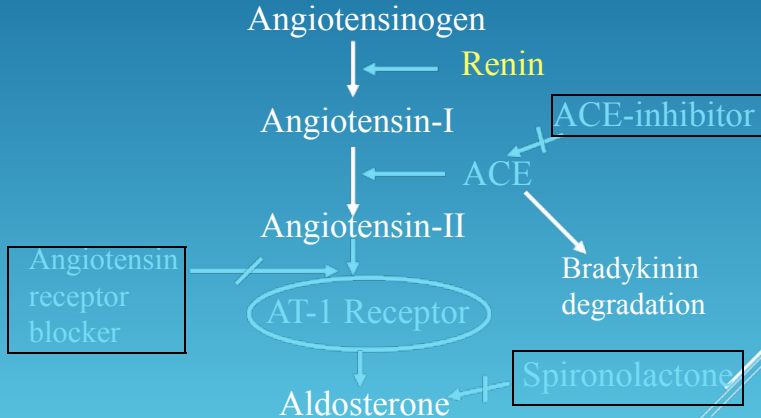

Beta-Receptor Density in Healthy Individuals and Patients with CHF

* $P < 0.05$.

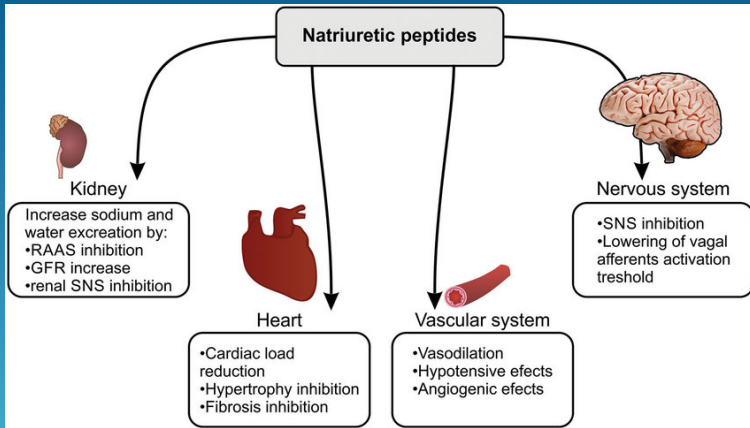

Mancini et al: *Am J Cardiol* 1989; 63:307-312.

RENIN-ANGIOTENSIN-ALDOSTERONE PATHWAYS

ANGIOTENSIN-II EFFECTS

- Vasoconstriction
 - Aldosterone production
 - Myocyte hypertrophy
 - Fibroblast proliferation
 - Collagen deposition
 - Apoptosis
 - Pro-thrombotic
 - Pro-oxidant
 - Adrenergic stimulation
 - Endothelial dysfunction
- 

NP

THE KIDNEY AND THE HEART FAILURE

- Reduced renal blood flow
 - Reduced glomerular filtration rate
 - Increased renin production
 - Increased tubular sodium reabsorption
 - Increased free water retention (vasopressin)
- 
- A series of several parallel white diagonal lines of varying lengths, located in the bottom right corner of the slide, extending from the bottom edge towards the right edge.

VENTRICULAR REMODELING IN HEART FAILURE

SCHEMA OF VOLUME CHANGES OCCURRING IN THE LEFT VENTRICLE

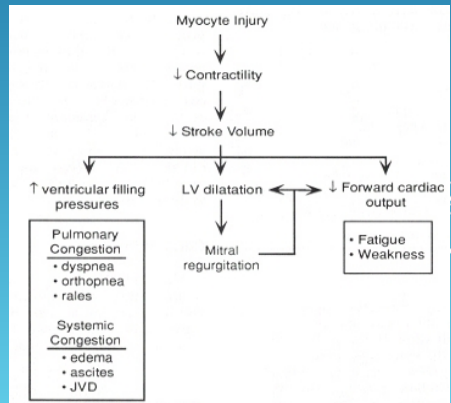

Ventricular Remodeling following MI

From: Pfeffer. *Am J Cardiol.* 1991;68:17D-25D.

CLINICAL FINDINGS

Biventricular Congestive Heart Failure

- Low forward Cardiac Output
 - fatigue, lightheadedness, hypotension
- Pulmonary Congestion
 - Dyspnea,
 - orthopnea, & PND
- Systemic Congestion
 - Edema
 - Ascites
 - Weight gain

PHYSICAL EXAM

Decreased C.O.

- Tachycardia

- BP and pulse pressure
- cool extremities (vasoconstriction)

- Pulsus Alternans (end-stage)

Pulmonary venous congestion:

- rales

- pleural effusions

Cardiac:

- laterally displaced PMI

- S3 (acutely)

- mitral regurgitation murmur

Systemic congestion

- JVD

- hepatosplenomegaly

- ascites

- peripheral edema

DIAGNOSTIC STUDIES

CXR -enlarged cardiac silhouette,
vascular redistribution interstitial edema,
pleural effusions

EKG –normal
tachycardia, atrial and ventricular
enlargement, LBBB, RBBB, Q-waves

Blood Tests
(KFT, BNP, ANA, RF, Fe²⁺, TFT's, ferritin,)

Echocardiography
LV size, wall thickness function
valve dz, pressures

Cardiac Catheterization
hemodynamics
LVEF
angiography

Endomyocardial Biopsy

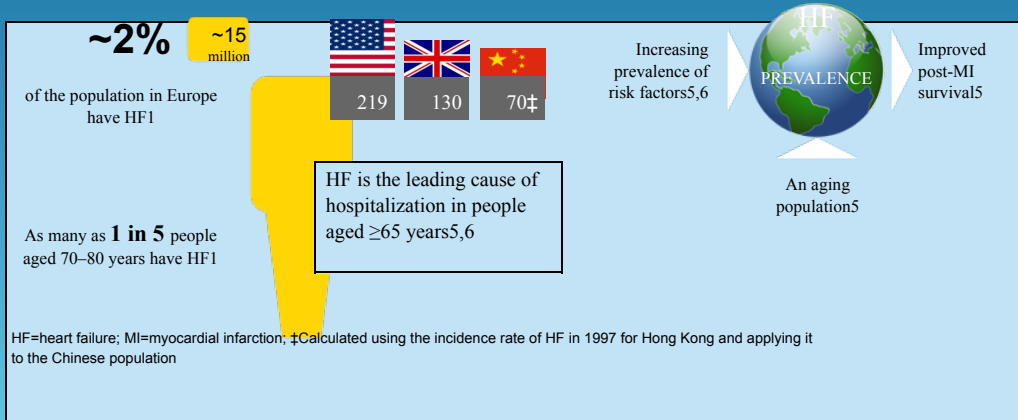

INFLUENCE OF EF ON SURVIVAL IN PATIENTS WITH HEART FAILURE

Vasan RS et al. J Am Coll Cardiol. 1999;33:1948-55

HF IS A MAJOR AND GROWING PUBLIC HEALTH PROBLEM

H
5

1. Dickstein et al. Eur Heart J 2008;29:2388–442; 2. Go et al. Circulation 2013;127:e6–e245; 3. Allender et al. Coronary Heart Disease Statistics 2008; 4. Hung et al. Hong Kong Med J 2000;6:159–62; 5. Hunt et al. J Am Coll Cardiol 2009;53:e1–90; 6. Kearney et al. Lancet 2005; 365:217–23; ; 5. Forman et al. Am Heart J 2009;157:1010–17; 6. Healthcare Cost and Utilization Project 2009 (http://www.hcup-us.ahrq.gov/reports/factsandfigures/2009/TOC_2009.jsp Accessed January 2013)

HF IMPOSES A SIGNIFICANT ECONOMIC BURDEN ON THE HEALTHCARE SYSTEM

OF THE COST OF HF IS DUE TO HOSPITALIZATIONS¹

OF THE COST OF HF IS DUE TO PHARMACOLOGICAL TREATMENT²

2030
2031

THE TOTAL COST OF HF IN THE USA ALONE IS EXPECTED TO INCREASE

~120% by 2030

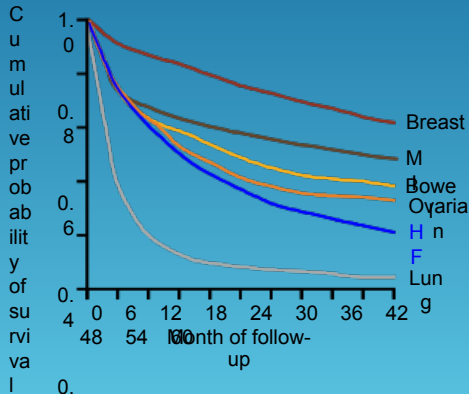

‡³

HF=heart failure; ‡USA estimate includes direct costs (total annual medical spending) and indirect costs (lost productivity due to morbidity and mortality)

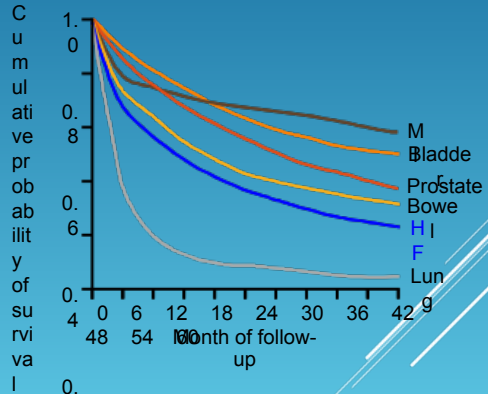

1. Dickstein et al. Eur Heart J 2008;29:2388–442; 2. Hunt et al. J Am Coll Cardiol 2009;53:e1–90; 3.Go et al. Circulation 2013;127:e6–e245

MORTALITY FOLLOWING ADMISSION FOR ACUTE HEART FAILURE EXCEEDS THAT OF MOST CANCERS

Female survival rates (%):
HF, MI and other malignancies

Male survival rates (%):
HF, MI and other malignancies

2 All patients with a first admission to any Scottish hospital in 1991 for HF, MI or the four most common types of cancer specific to men and women were identified, and 5-year survival rates compared

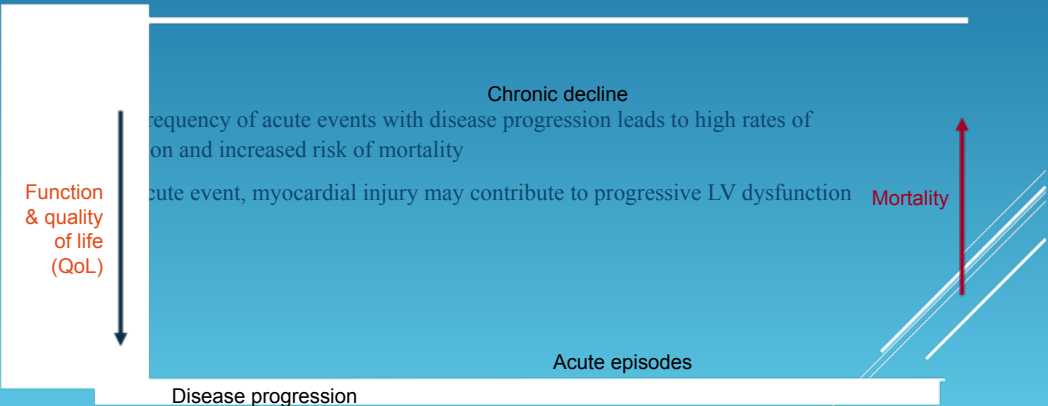

HF=heart failure

[‡]Data from 1,892 European patients with acute heart failure in the European Society of Cardiology Heart Failure (ESC-HF) Pilot study

[‡]Analysis of HF data from 1,282 incident cases of heart failure in the Atherosclerosis Risk in Communities (ARIC) population-based study of n=15,792 individuals from four communities in the USA (1987–2002)

1. Maggioni et al. Eur J Heart Fail 2010;12:1076–84; 2. Loehr et al. Am J Cardiol 2008;101:1016–22; 3. Maggioni et al. Eur J Heart Fail 2013;15:808–17

HEART FAILURE IS A PROGRESSIVE CONDITION WITH HIGH MORBIDITY AND MORTALITY

HEART FAILURE HAS A NUMBER OF COMMON CAUSES

- Most patients with HF experience symptoms due to impaired LV myocardial function¹
- The most common causes of HF are coronary heart disease (CHD), valve disease and cardiomyopathies²

*Including hypertension, diabetes, exposure to cardiotoxic agents, peripartum cardiomyopathy, etc.

- CHD is the underlying cause of 60–70% of acute HF cases³

1. Hunt et al. J Am Coll Cardiol 2009;53:e1–90
2. Dickstein et al. Eur Heart J 2008;29:2388–442
3. Nieminen et al. Eur Heart J 2005;26:384–416

HIGH PREVALENCE OF MULTIPLE CO-MORBIDITIES

Many patients with chronic HF have a range of co-morbidities that contribute to the cause of the disease and play a key role in its progression and in the response to therapy

hypertension*

ischemic heart disease*

diabetes mellitus

cardiac arrhythmias

ventricular arrhythmias

atrial fibrillation

respiratory disorders

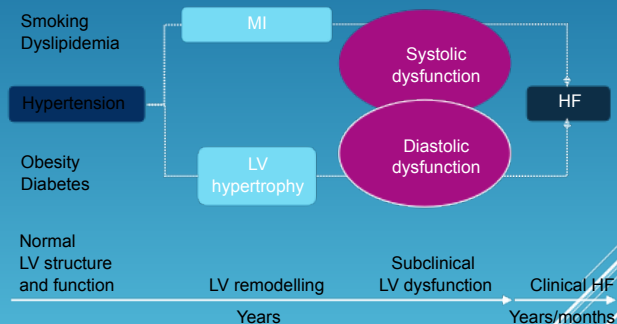

cognitive dysfunction

hyperlipidemia

chronic anemia

renal failure

arthritis

*Major contributors to development of HF

Krum, Gilbert, Lancet 2003;362:147-58

This can result in patients burdened with multiple pills per day, each with different dosage

GUIDELINE DEVELOPMENT

ACCF-AHA 2013

ESC 2012

HFSA 2010

NICE AHA 2014/
CHF 2010

Level of Evidence	
A	Multiple populations evaluated* Data from multiple randomized clinical trials or meta-analyses
B	Limited populations evaluated* Data from single randomized clinical trial or nonrandomized studies
C	Very limited populations evaluated* Consensus of opinion of the experts, case studies, or standard-of-care

Class of Recommendation	
I	Benefit >>> Risk Procedure/Treatment <i>SHOULD</i> be performed/administered
IIa	Benefit >> Risk (Additional studies with focused objectives needed) <i>IT IS REASONABLE</i> to perform procedure/administer treatment
IIb	Benefit ≥ Risk (Additional studies with broad objectives needed; additional registry data would be helpful) Procedure/Treatment <i>MAY BE CONSIDERED</i>
III	No Benefit: Procedure/test is not helpful and treatment has no proven benefit Harm: Procedure/test is expensive, without benefit or harmful, and treatment is potentially harmful to patients

HEART FAILURE DEFINITION

Heart Failure

AHF, acute heart failure; HF, heart failure

CLASSIFICATION OF HEART FAILURE

Based on the LVEF

Based on the Functional Status

Based on Clinical Progression

Based on Hemodynamic Status

Types	ACCF-AHA 2013	ESC 2012	HFSA 2010	NICE 2010
HFrEF	$\leq 40\%$	$\leq 35\%$	$< 50\%$	No thresholds of LVEF defined
HFpEF	$\geq 50\%$ <ul style="list-style-type: none"> 41%-49% (mrHF,) >10% to be >40% improved (HFpEF) 	$> 50\%$ <ul style="list-style-type: none"> 35-50% 'grey area'; most probably have primarily mild systolic dysfunction 	$\geq 50\%$	

HFrEF, heart failure with reduced ejection fraction; HFpEF, heart failure with preserved ejection fraction; LVEF, left ventricular ejection fraction

HEART FAILURE SUBTYPES

HF with preserved EF (HFpEF; HFnEF; DHF) vs HF with reduced EF (HFrEF; SHF): distinct HF phenotypes

B Ventricular remodeling in diastolic and systolic heart failure

HFpEF:

- * Preserved systolic LV function
- * No LV dilatation
- * Concentric LV remodeling/hypertrophy
- * Diastolic LV dysfunction

HFrEF:

- * Systolic LV dysfunction
- * LV dilatation
- * Eccentric LV remodeling
- * Diastolic LV dysfunction

Jessup, NEJM 2003;348:2007

CLASSIFICATION OF HEART FAILURE

Based on the LVEF

Based on the Functional Status

Based on Clinical Progression

Based on Hemodynamic Status

Class	Severity of symptoms and limitation of physical activity
I	No limitation of physical activity Ordinary physical activity does not cause symptoms of HF (breathlessness, fatigue, or palpitations)
II	Slight limitation of physical activity Comfortable at rest, but ordinary physical activity results in symptoms of HF
III	Marked limitation of physical activity Comfortable at rest, but less than ordinary physical activity causes symptoms of HF*
IV	Unable to carry on any physical activity without discomfort/symptoms of HF, or symptoms of HF at rest may be present If any physical activity is undertaken, discomfort is increased

guidelines further classify class III into IIIA (comfortable at rest, but less than ordinary physical activity causes symptoms of HF) and IIIB (comfortable at rest, but minimal exertion causes fatigue, palpitation, or dyspnea)

CLASSIFICATION OF HEART FAILURE

Based on the LVEF

Based on the Functional Status

Based on Clinical Progression

Based on Hemodynamic Status

Stages of HF	Development and progression of HF	Corresponding NYHA Class
A	At high risk for HF but without structural heart disease or symptoms of HF	None
B	Structural heart disease but without signs or symptoms of HF	I
C	Structural heart disease with prior or current symptoms of HF	I
		II
		III
D	Refractory HF requiring specialized interventions	IV

CLASSIFICATION OF HEART FAILURE

Based on the LVEF			
Based on the Functional Status			
Based on Clinical Progression			
Based on Hemodynamic Status			
Low perfusion at rest? (e.g. narrow pulse pressure, cool extremities, hypotension)	Congestion at rest? (e.g. orthopnea, elevated jugular venous pressure, pulmonary rales, S3 gallop, edema)		
		No	Yes
	No	Warm and Dry	Warm and Wet
	Yes	Cold and Dry	Cold and Wet

SYMPTOMS

LEFT SIDED ♥ FAILURE

- Paroxysmal Nocturnal Dyspnea
- Elevated Pulmonary Capillary Wedge Pressure
- Pulmonary Congestion
 - Cough
 - Crackles
 - Wheezes
 - Blood-Tinged Sputum
 - Tachypnea
- Restlessness
- Confusion
- Orthopnea
- Tachycardia
- Exertional Dyspnea
- Fatigue
- Cyanosis

©2007 Nursing Education Consultants, Inc.

RIGHT SIDED ♥ FAILURE

(Cor Pulmonale)

- Fatigue
- ↑ Peripheral Venous Pressure
- Ascites
- Enlarged Liver & Spleen
- May be secondary to chronic pulmonary problems
- Distended Jugular Veins
- Anorexia & Complaints of GI Distress
- Weight Gain
- Dependent Edema

©2007 Nursing Education Consultants, Inc.

SIGNS

Figure 24. CXR Showing Acute Decompensated Heart Failure

Method	ESC*	Purpose
ECG	IC	Shows the heart rhythm and electrical conduction. Important for decisions about treatment (e.g. rate control and anticoagulation for AF, pacing for bradycardia, or CRT if the patient has LBBB). It may show evidence of LV hypertrophy or Q waves (indicating loss of viable myocardium), giving a possible clue to the etiology of HF.
Chest X-ray 	IIaC	Most useful in identifying an alternative, pulmonary explanation for a patient's symptoms and signs. It may show pulmonary venous congestion or edema in a patient with HF.
Echocardiogram 	IC	Provides immediate information on chamber volumes, ventricular systolic and diastolic function, wall thickness, and valve function.

The echocardiogram and electrocardiogram are the most useful tests in patients with suspected HF

INVESTIGATIONS TO CONSIDER IN SELECTED PATIENTS

LABORATORY TESTS

Method	ESC*	Purpose
Biochemical and hematological investigations 	IC	<ol style="list-style-type: none">1. Determine whether RAAS blockade can be initiated safely (renal function and potassium).2. Exclude anemia (can mimic or aggravate HF).
Natriuretic Peptide (NP)	IIaC	<ol style="list-style-type: none">1. Where the availability of echocardiography is limited, an alternative approach to diagnosis is to measure the blood concentration of NP.2. NP levels also increase with age, renal insufficiency, but may be reduced in obese patients.3. A normal NP level in an untreated patient virtually excludes significant cardiac disease, making an echocardiogram unnecessary.

*ESC recommendation, class and level of evidence

NP: natriuretic peptide; RAAS: renin-angiotensin-aldosterone system

McMurray et al. Eur Heart J 2012;33:1787-847

CARDIAC NATRIURETIC PEPTIDES

- What is BNP?
 - A 32 amino acid polypeptide
 - Belong to a class of structurally similar natriuretic peptides (classes A,B,C and D)
 - Secreted by cardiac myocytes (mainly left) in response to excessive distension of the Heart ventricles
 - Similar to ANP (Atrial Natriuretic Peptide) but has longer t_{1/2} (~20mins, double that of ANP)
Named after extracts found in Pig-brain
- What is NT-proBNP?
 - NT-proBNP is a biologically inactive 76 amino acid N-terminal fragment
 - Co-secreted with BNP
 - Even longer t_{1/2} than BNP (~1-2hrs vs ~20mins)
- Biological effects of Cardiac Natriuretic peptides
 - Increase Natriuresis

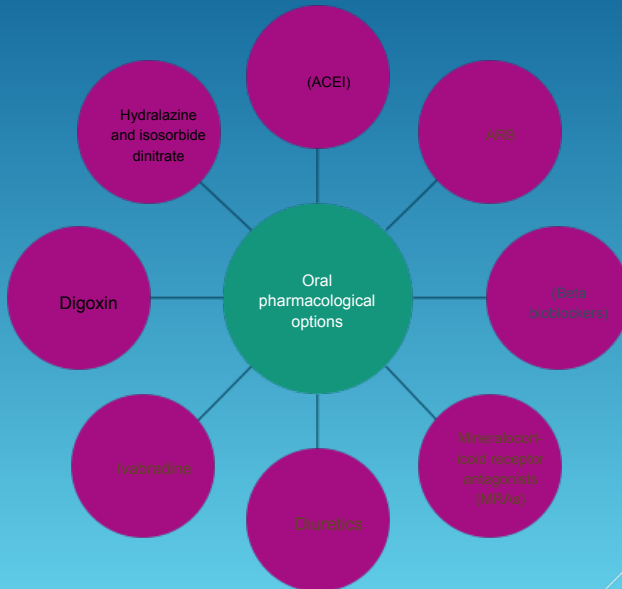

SYNTHESIS IN MYOCYTES

Figure 1: Biology of NT-proBNP and BNP

- Synthesis

MINERALOCORTICOID RECEPTOR ANTAGONISTS (MRAs)

MINERALOCORTICOID ANTAGONISTS (MRAS): THE FACTS

Mechanism of action	Indications	 Types & brands
Inhibit the binding of aldosterone to the mineralocorticoid receptor	Adjunct therapy for patients who continue to have symptoms despite treatment with diuretics and beta-blockers	Spironolactone (Aldactone®)* Eplerenone (Inspra®)**
Dosage	Risks	Key trials
Both start at relatively low dose, then titrated up according to efficacy and tolerability	Both agents associated with gastrointestinal disturbances, dizziness, electrolyte disturbances, gynaecomastia and renal impairment	RALES (Spironolactone) EMPHASIS-HF (Eplerenone)

*A non-proprietary drug is available

** A non-proprietary drug is not available

DIURETICS

DIURETICS: THE FACTS

Mechanism of action	Indications	Key drugs
<p>Thiazide diuretics - inhibit the reabsorption of sodium in the kidney's distal convoluted tubule</p> <p>Loop diuretics - inhibit absorption from the kidney's loop of Henle</p>	<p>Patients with heart failure are deemed to have volume overload</p>	<p>Bendroflumethiazide (thiazide) (Aprinox®, Neo-Naclex®)*</p> <p>Chlortalidone (thiazide-related) (Hygroton®)**</p> <p>Furosemide (loop) (Rusyd®*, Frusol®)*</p> <p>Bendroflumethiazide (loop)(Torem®)*</p>
Dosage	Risks	Key trials
<p>Bendroflumethiazide: 5-10 mg daily</p> <p>Chlortalidone: 25-30 mg daily</p> <p>Furosemide: 40 mg mg daily</p> <p>Bendroflumethiazide: 5 mg daily</p>	<p>Both types of diuretics associated with mild gastrointestinal side effects, postural hypotension, metabolic and electrolyte disturbances, blood disorders</p>	<p>Paucity of trial evidence for the efficacy of diuretics in HF. They are recommended for their beneficial effects on dyspnoea and oedema</p>

*A non-proprietary drug is available

** A non-proprietary drug is not available

IVABRADINE

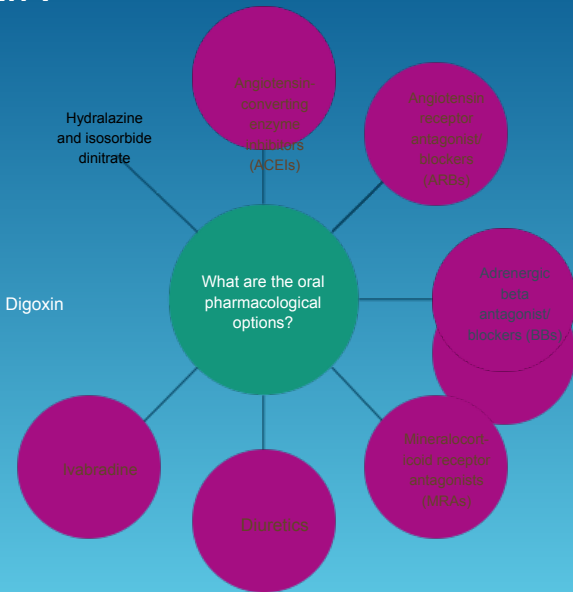

- Acts as a specific bradycardic agent, lowers heart rate by specific action on the sino-atrial node controlled by If current without affecting other cardiac ionic currents. It has no negative inotropic effect and has beneficial effects on left-ventricular systolic dysfunction. The only negative effects are vision disturbances which are mild and transient.

- Ivabradine is the first selective sinus node If channel inhibitor that results in a decrease in the slope of the diastolic depolarization in the SA node cells
- It is rapidly and almost completely absorbed after oral administration with a peak plasma level reached in approximately 1 hour under fasting condition.
- The absolute bioavailability of the 10mg dose is around 40%
- No side effects like sexual disturbances, respiratory side effects, bradycardia or rebound phenomena

- Indication
- Angina pectoris (2005) CHF (2012 in EU, 2015 in US); for use in heart failure patients inadequately controlled with optimal dose of beta-blocker (or intolerant) and whose heart rate is >75 bpm in EU and ≥ 70 bpm in US

DIGOXIN

DIGOXIN

Cardiac glycoside

Addresses heart failure symptoms by increasing myocardial contraction and reducing conductivity in atrioventricular node

Generally considered for patients with persistent symptoms

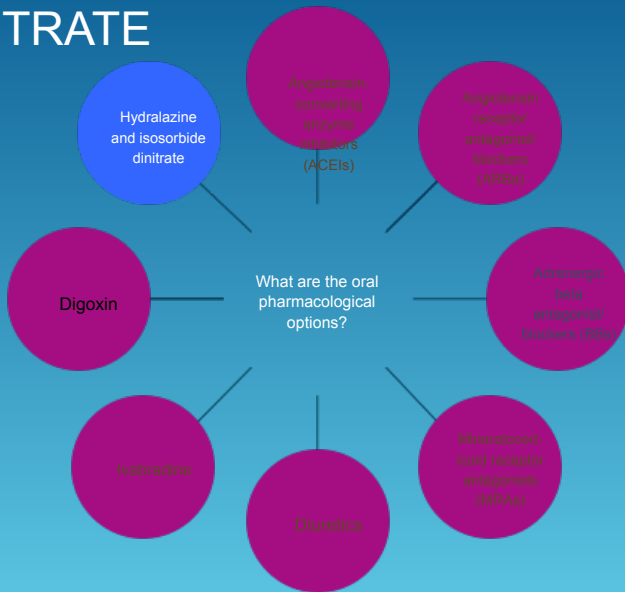

Despite other treatments - ACEI and BB + other agents e.g. spironolactone, ARB, or hydralazine/nitrate

DIGOXIN: THE FACTS

Mechanism of action	Indications	Brand
Improves the symptoms of HF by increasing myocardial contraction and reducing conductivity in the atrioventricular node	Chronic HF by systolic dysfunction. Its therapeutic effect is greatest in patients with ventricular dilation	Lanoxin®*
Dosage	Side effects	Key trial
62.5 mg -125 mg once daily	Nausea, vomiting, diarrhoea, arrhythmias, conduction disturbances, dizziness, visual disturbances, rash, eosinophilia and, less commonly, depression	DIG

*A non-proprietary drug is available

HYDRALAZINE AND ISOSORBIDE DINITRATE

HYDRALAZINE AND ISOSORBIDE DINITRATE: THE

Mechanism of action	Indication	 Brand
Both have vasodilatory (and hence hypotensive) effects, while nitrate therapy also reduces venous return, thereby lessening the work of the left ventricle	Moderate-severe congestive HF (reduces symptoms where optimal dose of diuretics and cardiac glycosides alone insufficient. In patients with high left ventricular filling pressure, it is recommended to combine hydralazine with a nitrate)	Apresoline®*
Dosage	 Side effects	Key trial
25 mg 3-4 times daily, increased every 2 days if necessary. Usual maintenance dose 50-75 mg 4 times daily	Both agents may cause tachycardia, flushing, hypotension, gastrointestinal effects, headache, dizziness	A-HeFT

*A non-proprietary drug is available

SUCCESSFUL INTERVENTION BY ADDRESSING NEUROHORMONAL ACTIVATION

- Chronic HFrEF survival rates have improved over time with the introduction of new therapies

- However, significant mortality remains5

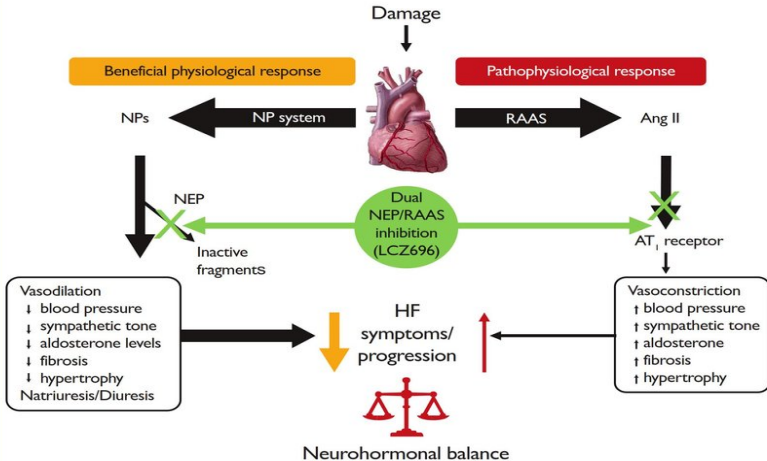

*On top of standard therapy at the time of study (except in CHARM-Alternative where background ACEI therapy was excluded). Patient populations varied between trials and as such relative risk reductions cannot be directly compared. SOLVD (Studies of Left Ventricular Dysfunction), CIBIS-II (Cardiac Insufficiency Bisoprolol Study II) and RALES (Randomized Aldactone Evaluation Study) enrolled chronic HF patients with LVEF \leq 35%. CHARM-Alternative (Candesartan in Heart failure: Assessment of Reduction in Mortality and Morbidity) enrolled chronic HF patients with LVEF \leq 40%.

ARR=absolute risk reduction; MRA=mineralocorticoid receptor antagonist; RRR=relative risk reduction

2021 ESC HF GUIDELINES RECOMMENDATIONS FOR THE MANAGEMENT OF PATIENTS WITH HFREF

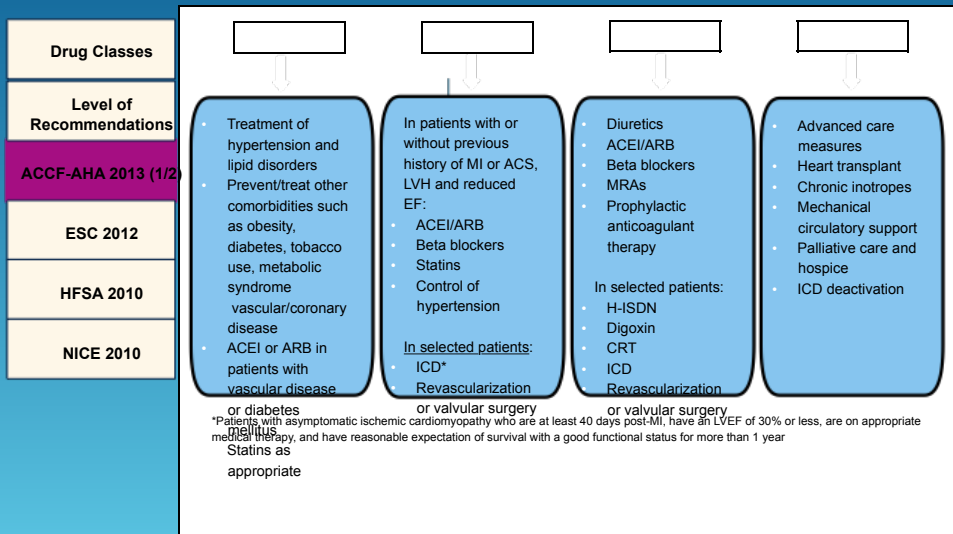

Management of patients with HFrEF¹

- The 2021 ESC HF Guidelines now recomme

Pharmacological treatments indicated in patients with HFrEF (LVEF $\leq 40\%$; NYHA class II–IV)

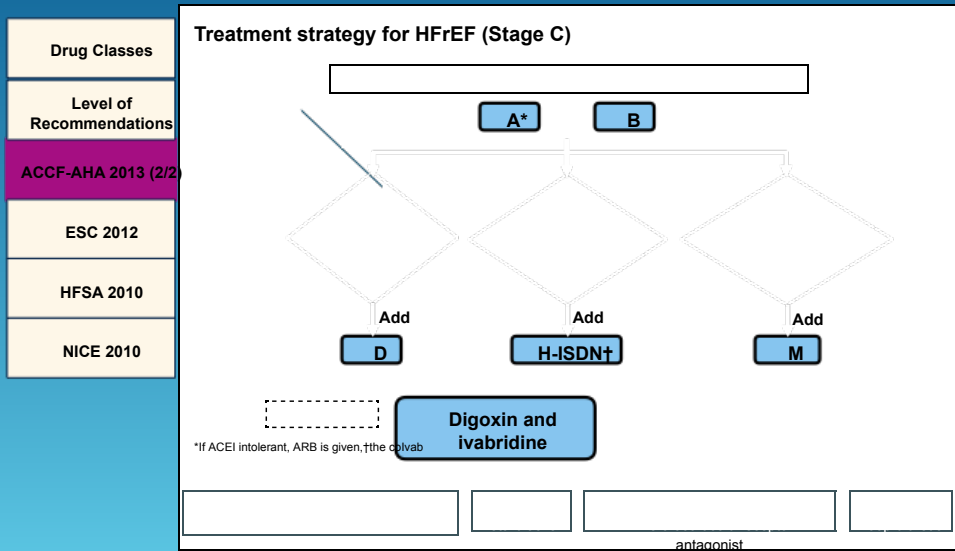

Recommendations	Class of recommendation	Level of evidence
An ACEi is recommended for patients with HFrEF to reduce the risk of HF hospitalization and death	I	A
A BB is recommended for patients with stable HFrEF to reduce the risk of HF hospitalization and death	I	A
An MRA is recommended for patients with HFrEF to reduce the risk of HF hospitalization and death	I	A
Dapagliflozin / empagliflozin are recommended for patients with HFrEF to reduce the risk of HF hospitalization and death	I	A
Sacubitril/valsartan is recommended as a replacement for an ACEi in patients with HFrEF to reduce the risk of HF hospitalization and death	I	B

PHARMACOLOGICAL THERAPY – CHF

ACEI, angiotensin converting enzyme inhibitor; ACS, acute coronary syndrome; ARB, angiotensin receptor blocker; CRT, cardiac resynchronization therapy; EF, ejection fraction; H-ISDN, hydralazine and isosorbide dinitrate; ICD, implantable cardioverter-defibrillator; LVH, left ventricular hypertrophy; MI, myocardial infarction; MRA, mineralocorticoid receptor antagonist

PHARMACOLOGICAL THERAPY – CHF

ACEI, angiotensin converting enzyme inhibitor; ARB, angiotensin receptor blocker; Cr., creatinine; HFrEF, heart failure and reduced ejection fraction; NYHA, New York Heart Association

LBBB

ICD

Device implantable inside the body, able to perform both cardioversion, defibrillation and pacing of the heart

Indications

- Ventricular tachycardia and ventricular fibrillation (Secondary prevention)
- Prevention of sudden cardiac death (SCD). Patients with an EF <35% (Primary prevention)

CRT: CARDIAC RESYNCHRONIZATION THERAPY

1. Improved hemodynamics

- Increased CO
- Reduced LV filling pressures
- Reduced sympathetic activity
- Increased systolic function w/o MVO₂

2. Reverse LV remodeling/architecture

- Decreased LVES/ED volumes
- Increased LVEF

CRT INDICATION NYC II-IV WITH LBBB

- Improved exercise tolerance
 - Reduce symptoms
 - Reduced remodeling
 - Reduced mortality
 - Reduce need for hospitalization rhythm
- 

THANK YOU
